Weekend of January 30-31, 1971 PER COPY 15¢

Bendix Corp., based in Southfield and with a plant in Ann Arbor, will be deeply involved in the Apollo 14 moonflight beginning Sunday. Above: A Bendix technician in space suit demonstrates the "thumper" that will fire 21 cartridges into the moon's surface to detect water. Top right: A passive seismometer will measure quakes. Below that, technicians work in an air-showered, lint-free assembly room. Lower right: Bendixmen operate the 40-story mobile service structure at the launch pad as well as a 3.5 million-lb. crawler supporter that got it there. Left: Another Bendixman holds the device to monitor the descending engine thrust. Lower left: Bendix's six-experiment package will look like this on the moon. Below: The Saturn 4 rocket's inertial guidance system.
