U-M DOCTOR URGES FOSTER HOMES FOR ABANDONED BABIES

Neglected or abandoned infants placed in institutions at the time of birth may suffer severe personality disorders, according to a University of Michigan psychiatrist.

Only a foster home can provide the warm, personal mothering so necessary in the early mother-child relationship that is needed for normal personality growth, he said.

Institutionalized infants suffer from a lack of warm, human contact and attention and this may result in severe personality disturbances, Dr. Rabinovitch explained.

He declared that there is ample evidence to indicate that a majority of children with severe emotional problems can be successfully treated.

find satisfaction in keeping with its abilities, he added.

However, treatment must often be intensive and facilities throughout the country must be greatly expanded to begin to meet the needs of the disturbed mind, he stressed.

In regard to delinquent children, he indicated that the surest way to perpetuate the patterns of delinquency is for the community to treat the delinquents with hostile and punitive action.

Communities must realize that antisocial or delinquent behavior stems from psychological and emotional problems, Dr. Rabinovitch explained.

There is no "sure cure" for bovine mastitis, according to Dr. B. J. Killham, Michigan State College extension veterinarian.

U-M FORESTER ASKS THAT ALASKA STAY AS LAST FRONTIER

The old Alaska of abundant game and individualism, which the sourdoughs love so well, is melting fast, says Dow Baxter, professor of forest pathology at the University of Michigan.

Our last frontier, according to the forester, is taking on the appearance of the standardized American main street. Professor Baxter has spent 14 summers in Alaska and witnessed the changing conditions.

Caribou are in danger of becoming extinct, he reports, and cover in Interior Alaska for wildlife is being burned off at an alarming rate. Alaska needs to preserve game and, through management, prevent what has happened to wildlife resources in this country, the professor says.

"We are destroying the atmosphere we go to Alaska to see and enjoy," Professor Baxter asserts. The old sourdough and bush elements, he points out, but they are lethally afraid of competition and hub-bub.

"The professor, whose Alaskan friends consider him a resident of the northern territory who just winters in Michigan, suggests that we make the "last frontier" a resource in itself. Natural resources, should be used for making the country richer but not exploited.

The problem is being met by the farseeing plans of the United States Forest service which is trying to apply lessons we have learned elsewhere, he says.

The service is making every effort to make available on a sound basis the vast forests of southern Alaska for pulpwood. Unlike many of the present important industries of the territory the pulpwood industry can furnish jobs the year round, he claims.

"Let's have Alaskans in charge of things up there; they know the country and their interest is there," he suggests.

A pig is the nearest relative to a hippopotamus.

Take Pride In Precision Of Your Garden Layout

Garden Rows Should Be Straight and Parallel for Efficient Production.

When vegetables or flowers are grown in rows, every five minutes you spend in making the rows straight, parallel, and the whole layout square and precise will save an hour in the work of caring for the garden later on.

Payment in pride will be even greater, since an orderly garden is pleasant to work in, and to show your neighbors. An exception to the rule for straight rows may be made in hilly country, where the wash of soil may be checked by contour planting.

For crops growing twelve inches tall or less, rows may be spaced two inches to a foot apart and cultivated with hand tools. For cultivation with a wheel hoe, eighteen inches is likely to be found a minimum distance, since it is necessary to avoid disturbing the roots of the vegetables, whatever tool is used.

First, decide on the crops you will grow, which should be those that your family likes, or ought to like. Next, determine the quantity of each which you will try to produce, which should be the amount you will eat in the fresh state, plus what you will put up for next winter.

Rows are spaced with varying distances between them, depending on two factors: The needs of the crop, and the convenience of cultivation. In rich soil vegetables may be spaced more closely than in poor soil, but when spaced too close together, it is difficult to cultivate between the rows.

Serpentine, slanting or uneven rows will double the work of cultivation, and give an appearance of incompetence to the garden.

Rows are spaced with varying distances between them, depending on two factors: The needs of the crop, and the convenience of cultivation. In rich soil vegetables may be spaced more closely than in poor soil, but when spaced too close together, it is difficult to cultivate between the rows.

The Grist Mill

By ED ALCHIN Oakland County Agricultural Agent

Looks like spring has been delayed by our winter. However, it is hoped by the time readers see this, there is a big change in the weather.

Speaking of weather, the first break we get is time for farmers to take soil samples to be tested this spring. With our new soil equipment which we have at the present time, we will be able to test for phosphorus, potash and lime.

In taking soil tests, it is important that the job be done properly. In each field where the soil seems to vary in color or in texture, a sample should be taken. Stick a shovel into the ground its full depth and tip it over.

Having prepared your production schedule, make a simple plan of your garden and proceed to lay it out accurately before beginning to sow. This plan should be kept through the season, to guide you in second plantings and enable you to note the errors in planning you may have committed, and which can be corrected another year.

DON'T BLAME THE MICHIGAN FARMER FOR SPUD SURPLUS

If you're getting that finger ready to point at the Michigan potato farmer in trying to find some one to blame for the current potato surplus problem, you had better look elsewhere.

Michigan farmers produce more than four times the amount of fertilizer they buy each year.

About 30,000,000 tons of manure are produced on Michigan farms annually. It contains about as much fertilizer elements as are included in 30,000,000 hundred pound bags of 10-5-10 fertilizer.

A. G. Weldemann, soil science researcher at Michigan State College, says through careless handling, farmers are losing much of the value of this farm produced fertilizer.

Physical Ed. Teacher Attends Convention

Miss Betty Lou Myers, Clarenceville girls athletic director, attended the American Association of Health, Physical Education and Recreation convention in Chicago last week.

The convention lasted from Wednesday to Saturday noon. Demonstrations included square dancing, modern dancing, recreation, health, creative rhythms, and mixed games.

Preceding every demonstration the convention members were entertained by choice music groups from the Chicago schools.

Over 1600 were on the convention register.
