Paint or stain?

Continued from Page 5

painting job. It's important to avoid mistakes at the outset by choosing the appropriate coating and applying it properly.

The two basic types of interior paint—primers and finish coats—are designed specifically for woods, metal or masonry surfaces. Your dealer can advise you on products which are longer wearing, easier to apply or flatter or glossier than last year's model. For current information your paint dealer is very knowledgeable.

One of the most popular finish coats is texture paint. This covering can add a custom plaster look to your ordinary wall-board. Most are easily applied with a roller or brush and come in a selection of

attractive colors. For old or new walls texture paint can cover cracks or flaws. It is specially formulated to retain brightness and texturing while drying out. Most brands permit you to create your own texture design and add architectural interest. Should you decide to paint over a textured wall, simply use latex or oil-based paint.

Applying paint or stain is actually the easiest part of your home decorating project. The surface preparation is the burden of your labor and it pays off in the quality of results. Another important aspect is color selection. The dozens of paint and stain color choices can be overwhelming. Consult decorating magazines and books for a variety of creative ideas that allow you to really express yourself.

Fall pool hustling prevents trouble with a capital T

Another summer passed. Those cool fall days here again. Time to close your outdoor swimming pool for another season. How should you do it?

The best way is to take a clean, subsurface water sample to your nearest swimming pool chemical dealer.

He is specially equipped to scientifically analyze your water and give you specific winterizing instructions, whether your pool is in the frozen north or in milder climates where temperatures merely drop to too cool for comfortable swimming.

Did you know, for instance, that algae those summer time pool nuisances, don't really die in the winter? they remain dor-

mant, ready to start growing again when warm weather returns.

And do you realize that scale formation and corrosion take place even in cold winter pools if the water is not properly balanced?

And, of course, you should never, never, use dangerous automotive anti-freezes in your pool lines or pumps, as they are quite toxic and not designed for that purpose.

The presence of dissolved metals, improper pH, winter temperature extremes and other factors all combine to cause staining, pool deterioration and maintenance problems that are costly and must be remedied before you can use your pool next season.

HINSON HEATING & AIR CONDITIONING, INC.

"The Efficient Shall Inherit The Earth ..."

The Lennox Pulse® Truly the Furnace for the 80's

The Lennox Pulse® gas furnace is the most significant breakthrough in furnace design in over 20 years. It produces heat unlike any other furnace with greater efficiency and safety than ever before possible.

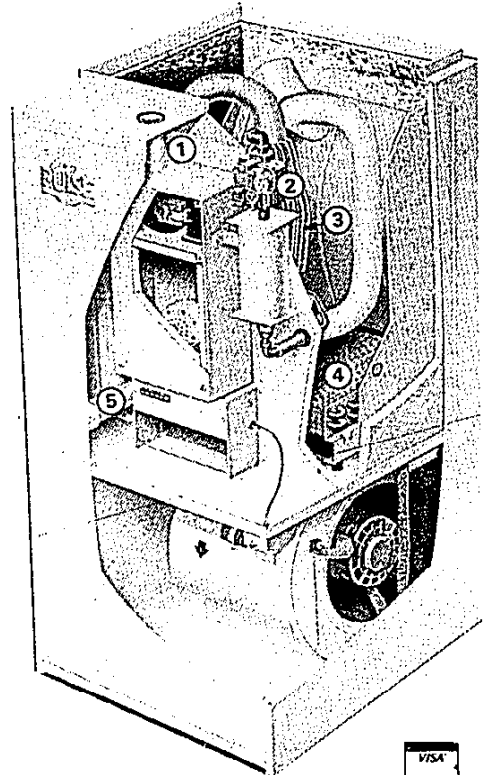

If your present gas furnace is over five years old, it is in the range of 55% - 60% efficient, compared to the Pulse's 91% - 96%. This difference can mean drastic reductions in your monthly heating bills—up to 40% savings! Due to the reduction in gas consumption, The Pulse justifies replacing your present unit today, and can pay for itself in as little as two years. The Pulse furnace is that efficient.
