PICKING UP A DAMAGED SUBMARINE CABLE
"Cable Crossing—Do Not Anchor." This warning on huge signs in many of our larger harbors serves to give notice to boats and ships that at such points is laid the submarine telephone cable and that to cross there is dangerous. Notwithstanding, these cables occasionally must be hauled up and repaired when damaged by a dragging anchor or when scraped by a large vessel. A notable instance of this occurred during the past summer when the United States Shipping Board Steamer "West Cobalt" to avoid a collision with another ship, threw out its anchor as it was passing under the Brooklyn Bridge. The anchor dug deep into the submarine cable between Manhattan and Brooklyn, making it necessary to lay a new cable. Submarine cables are used to save distance or as a means of extending telephone circuits where land lines are not possible, as, for example, across rivers where there are no bridges, and harbors, bays and estuaries where there is no other way to get across. The largest, loaded duplex submarine cable in the world is across Harton Bay in New Jersey. It is 28,248 feet long. The most famous deep sea submarine telephone cable is between Key West and Havana. There are in the Bell System approximately 80,000 miles of wire submarine cable.

Army Trains Pigeons for Hazardous Flights

Possible extensive use of pigeons in directing artillery fire is engaging the attention of the signal corps of the army, says an Associated Press dispatch from Washington. Observers in advanced positions relearn the birds carrying messages tell where the shells are falling; and they are trained to fly back to the lines. This method would be used when other channels of communication, such as radio or telephone, were not available. The Germans utilized pigeons to direct artillery fire on the eastern front during the World war. There are now 1,500 pigeons at various posts in the keeping of the signal corps, which has a breeding center for them at Camp Vail, N. J. The birds are retained at the various army corps area headquarters, in the insular possessions and in Panama. It takes from ten days to two weeks, officers say, to train a pigeon to return to its loft and get its bearings. Pigeons do not fly well at night and as a rule are not outstanding in intelligence. Difficulty has been experienced with pigeon fanciers in a war, who wish to make pigeons a major method of communication. Only one bird in ten is considered capable of flying 500 miles in one day. In the Canal zone hawks constantly menace pigeons while in flight. To overcome this a whistle is fastened to the tail of the bird, and as it flies the rush of air causes the whistle to sound and frightened away birds of prey.

Three Odd Specimens of Neptune's Realm

The leaf fish, inhabitant of the quiet bays and inlets of the Amazon, may be considered the most curious of fishes, says Nature Magazine. The eggs hatch in three days in their warm water. Naturally the young hatched fish are suspended by threads from the under side of the leaves. Then there is the butterfly fish which remains absolutely motionless throughout the day. It may always be found at the same spot near the surface of the water, but when twilight falls it becomes more animated. Flounders live on the sandy sea bottom. They are difficult to see because they change their color to match the floor of the sea.

Hydrotherapy in Medicine

Hydrotherapy, or the use of water as a remedy in the cure of sickness, was largely employed by Hippocrates in the treatment of many kinds of disease. It is mentioned by Horace, who speaks of the physician of Emperor Augustus, using this method for treatment of ailments throughout the Middle Ages, likewise there were many practitioners who used hydrotherapy. In 1820 Vincent Preisnitz began a new era for the water cure. The undoubted merits of hydrotherapy called to its defense many men of standing in the profession who became interested and studied it scientifically, and from their advocacy has sprung up the school of hydropathic physicians. Doctor Winternitz of Germany, in 1883, laid down the scientific principles of modern hydrotherapy.

Luxuriant Egyptian Homes

The homes of the Egyptians were beautifully designed, furnished and kept. They were a notable as well as an extremely artistic people, and lived most comfortably. They never allowed the weather to interfere with their comfort and health. When it was warm weather, their rooms were thrown open to the largest of free air. When it became cold, charcoal furnaces were requisitioned, and these warmed the rooms. The house always had exceptionally high ceilings and opened out to long large halls or courtyards. The large air spaces thus obtained were relied upon to dilute the fumes from the charcoal and to prevent poisoning.

Record Hen's Egg
What is believed to be the largest ever laid by a hen recently came into the possession of the poultry department of Oregon Agricultural college. The egg weighed 11 ounces and measured 8 1/2 by 11 inches in circumference. It is 1/2 inches long or twice as long as the average hen's egg.

Birds Lightning Victims?
David L. Beach, of Athol, N. Y., found a large number of sparrows apparently killed on the ground early one morning. He picked them up and one by one they revived. It is believed they had been shocked in an electrical storm of the night before while in nearby trees.
