Eclipse fans abandoned vigil after climax passed

At precisely 1:16 p.m. on May 20, the collective voice of the crowd that had gathered to wit-ness the annular

RAYMOND E.

RAYMON

The weather for the celipse was nearly perfect; a stray cloud blocked a portion of the sun at times, but for the most part viewing was superb. Alas, many people in the United States and Canadad did NOT believe the warning about looking directly at the sun and observed the celipse with the naked eye. A number of people in Quebec (and, no doubt, elsewhere) now have permanently im-

paired vision. One teenage girl was quoted as saying, 'I didn't believe the warnings.' An ophthalmologist is tying to restore some of her vision.

The sun, the nearest star to us, is a mixed blessing. Without it, life on this planet would not be possible; however, without the earth's come layer, that same life-giving aun would eradicate nature.

possible; however, without the earth's ozone layer, that same life-fiving aun would eradicate nature.

Even the ozone layer doesn't provide complete protection, and that's why it is a wise decision to wear sunscreen when outdoors. That goes without saying in July and August, but few people realize that the sun's rays in June ARE AS POTENT as those in July. The sun's altitude on June 1 will be 70 degrees, and that's exactly what it is on July 10.

The difference is that in June the sun will be getting higher as the start of summer approaches, while in July it will be getting lower. Why is it so much hotter in July than in June? Because there is a lag while the planet absorbs the solar energy and heats up. Believe it or not, the sun's altitude in August closely matches that in April, but what a difference in temperature!

Besides welcoming the arrival of summer in June, skywatchers will be treated to the most excellent evening appearance of Mercury in 1994 and the year's 'lowest' full moon.

Last quarter moon will occur at two minutes after midnight on the first day of the month. If you look toward the southeast, about 45 minutes before sunrise, you will see a bright star below and to the right of the moon. This will be the planet Saturn. Saturn's beautiful ring system can be seen with a small telescope. Right now the rings will appear to be very thin as they will be tipped only five degrees.

Facing west after sunset on June 3, skywatchers will have no

grees.
Facing west after sunset on June 3, skywatchers will have no difficult spotting Venus. It will

look like a very bright star. Di-rectly above Venus will be the star Foliux in Geminit to the right of Foliux will be Castor. Fast-moving Venus will form a straight line with the two stars and the moon in just nine days. If we imagine that Venus marks the center of a large clock, then Foliux will be at 12 o'clock, and Castor will be at 12 o'clock. Down at 5 o'clock will be another planet, but nowhere near as bright as Ve-nus.

but nowhere near as bright as Venus.

The planet will be Mercury, making its finest appearance in the evening sky. Binoculars will help you locate star-like Mercury. Once you have spotted it end know its general location, you should be able to see it without using binoculars. But it won't be visible for long. By mid-month this fastest moving of the planets will be too close to the horizon to be seen.

The bright star below and to the left of the moon on the morning of the 5th will be the orangered planet, Mars. On the following morning the moon will have passed Mars and will not be left of that planet.

New moon will be at 4:26 a.m. on June 9. The moon will be located to the left of that planet.

New moon will be at 4:26 a.m. on June 9. The moon will be located between the earth and the sun and will not be visible.

Watch Venus shift its position,

sun and will not be visible.

Watch Venus shift its position, with respect to Castor and Pollux, from June 10 through 12. On the evening of the 10th, Venus will be about five degrees (10 full moon dismeters) to the left of Pollux. Venus will be alightly below a line drawn from Castor through Pollux.

On the following evening Venus will be slightly higher, a little closer to the line. Notice the moon, directly below Venus.

The only thing as pleasant as buying a Saturn is *leasing* one.

We hope you've heard how unstressful we try to make it for you when you visit a Saturn showroom. (Because who needs more stress, right?) Anyway, we take the same approach to leasing as we do to everything else. So if leasing a Saturn is better for you than buying one (and we can help you figure that out), then great. The only important thing is to find out how pleasant

driving a Saturn can be. leure part for occurity to be June Jd. 1994 Par
