SAN AMERICANO

2 Remap Hearings In Area

Two public hearings will be held in this area by the State Legislative Reapportionment Commission, the agency responsible for drawing up new districts for the Michigan Legislature.

One will be held Thursday, Dec. 9 at 1 p.m. in the commissioners auditorium of the Oakland County Building on Telegraph Rd. just outside Pontiac.

The other is scheduled for Friday, Dec. 10 at 10:30 a.m. in the City-County Building in Detroit.

The eight-member commission is composed of four Republicans and four Democrats. Co-chairmen are Paul G. Goebel (R-Grand Rapids) and A. Robert Kleiner (D-Grand Rapids). Only Observerland member is Anthony C. Licata (R-Plymouth), a former state representative from Detroit.

If the commission deadlocks—which is a strong possibility—then the State Supreme Court will select an apportionment plan. The court has a 5-1-1 Democratic majority.

RO-BOX Drugs

Illicit LSD Can Cause Damage

Questions should be sent to the Community Commission on Drug Abuse, P.O. Box Drugs, Livonia, 48151.

Q. I would like some information if you can get it for me and print it in your P.O. Box Drugs. Some reports have told that steady use of LSD or acid can break down chromosomes and cause birth defects. Assuming this is true, do the chromosomes rebuild after you stop using it for good? and were only a mild user (once a week.) I hope you can answer my questions. Thank you.

Mrs. K.B. Westland

A. We'll try to give you the best answers we can and then give a little background.

About the best response we can find at this time is that LSD, taken in moderate doses, does not produce chromosome damage detectable by available methods. As for inducing mutations, LSD may have a very weak effect in this respect but not at the dose levels normally used. Reports of LSD-related birth defects have not been conclusively proven.

Where a great amount of concern regarding chromosome damage and birth defects has come from is regarding studies of effects of LSD on various test animals. Quite often the doses administered to these animals are 100 times or more than the human dose. At these fantastically high dose levels some of the effects you mention may be produced. Even so, there is no real certainty that the effects produced on hamsters, for example, would be produced in man.

Another type of testing has been the effects of LSD on cells in a test tube. Again the concentration of LSD is generally much higher than would be reached in normal human usage. As a result, any effects on cells demonstrated in such a manner are questionable.

NOW LET'S mention a few practical matters involving the use of LSD. Although ingestion of pure LSD (as available for clinical investigation) did not seem to result in many of the effects you mention, the use of illicit LSD seemed to result in three times as many cases of alleged chromosome damage as reported with the pure substances. And what is being sold in this area is rarely pure.

What's the reason for this, effect? Nobody is sure, but there are several possibilities: (1) Illicit LSD may contain other by-products which possibly could produce this effect. (2) These effects may be caused by any of a number of drugs used in place of, or along with, LSD such as DET, DMT, STP or amphetamines to name but a few.
