ADVISE NEW FLY CONTROL METHODS FOR DAIRY COWS

New advice on fly control came this week from officials of Milchigan State College and the U. S. Department of Agriculture. They recommend that methoxy-chlor replace DDT as an insect control spray on dairy cows because of possible contamination of milk with the DDT spray material. No case of injury to humans is known, but the fact that the presence of DDT even in minute quantities in milk would be contrary to pure food laws makes the new recommendation necessary.

recommendation necessary.

Ties of DDT to control files on animals other than cows is still undvised. DDT can be used to control files on beet cattle and swine if 60 days elapse between application and slaughter of the animals. DDT can still be used to control files in breeding places and restring places outside dairy barns. Manure piles and moist soil mixed with manure are typical places where files multiply.

Ray Hutson, head of the MSC

files multiply.

Ray Hutson, head of the MSG
entomology department, Dr. Earl,
Weaver, datry department head,
and George Brown, animal husbandry department head, have conferred on federal findings and advise that methoxychlor is the material to use for dairy cattle fly
control. The recommendations, being carried to farmers through MSG
ing carried to farmers through MSG
tension Service, call for the use of
methoxychlor inside dairy barns
and directly upon dairy cows.

methoxychlor inside dairy barrs and directly upon dairy cows. County agricultural agents have been notified of the new spray program and are ready to give farmers advice in using the methoxychlor in place of DDT on dairy cattle.

clation for the five principal dairy breeds.

Officials say the group will ad-tempt to coordinate standardizing in exhibits at regional and county fars and the Michigan State Pair. In addition the group will assist educational groups in programs that encourage breeding better dairy cattle through the use of purebred seedstock.

Spring clean-up is a good prac-tice on the farm these days, Mi-chigan State College extension spe-cialists advise. Refuse should be removed from barnyards and feed lots. Old piles of manure and rub-bish may be heavily infested with livestock parasites.

List Price Support For 1949 Bean Crop

Price supports for the 1949 crop f dry edible beans were explained his week by Clarence Prentice, ex-

of dry edible beans were explained this week by Clarence Prentice, extension agricultural economist at Michigam State College.

Loans and purchase agreements available to producers will be used to carry out the price supports as 50 per cent of the party prices authorized by the new flexible farm price support program which allows the secretary of agriculture to determine the support level anywhere hetween 60 and 90 per cent of parity.

With the 1948 crop the second largest on record and with a reduction of the second considerably above requirements. Since a further decline in exports is expected, the support price level is being reduced to 50 percent for parity from the 90 percent level for the 1948 crop. Also, it is expected that large supplies of beans will be acquired by the CCC under the 1948 rpice support. The program is intended to provide adequate supplies for consumers and a floor price for producers.
