

## Burroughs Teller Consoles made in Plymouth link bank tellers with computer

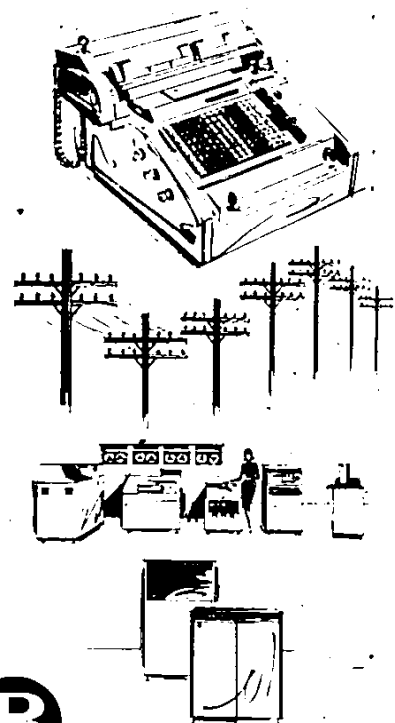

Burroughs Corporation is leading the way in On-Line Savings—a new idea in banking service that's taking hold across the country.

The On-Line Teller Console manufactured at Burroughs Plymouth Plant plays a major role in this advanced banking system. An On-Line Teller Console, right at the teller's fingertips, is connected by phone lines to a computer which holds all savings account records.

With this system, the teller has instant access to all account information and can handle a savings transaction in seconds. All records are kept with up-to-the-second accuracy. Dividend information and previously unposted transactions are printed along with the current transaction in the customer's passbook to keep him up-to-date. Customers may use any branch of their savings institution at their convenience. And, one Burroughs On-Line System may serve dozens of institutions and millions of accounts.

The flexibility of this system, and especially of the On-Line Console, allows an institution to "go on-line" without disrupting customer service in any way. Faster, more complete service is the only indication to the customer that anything has changed.

Teller Consoles made in Plymouth are operating in installations throughout the nation and helping to bring the most sophisticated banking service available today to millions of savings account customers.
