# Drain Shade Trees Properly

Planting a shade tree is not a difficult job, but certain procedures must be followed to give the tree the best chance of survival. Soil conditions must be favorable, proper planting techniques must be observed, and good maintenance must be provided during the season following planting.

USUALLY most of the soil excavated in digging the hole is of too poor quality to be used in planting. For this purpose screened topsoil should be used; an ample supply should be obtained before planting operations begin.

The hole must be deep enough to permit planting the tree to the same depth at which it originally grew, and of sufficient diameter to accommodate the root spread. The point of development of the upper roots is an indicator of planting depth;

the tree should be set deep enough to permit covering these roots with 2 to 3 inches of soil. All roots must be spread to their full extent; if cramped they are likely to grow in a circular pattern, press against other roots or the central stem, and girdle these parts.
