**TERRAMYCIN**

One of the newest antibiotics to be made available, terramycin is a product derived from a mold found in the soil—*Streptomyces rimosus*. It was discovered in 1950, after the screening of some 100,000 soil samples.

Terramycin is effective against a wide variety of micro-organisms, and it is proving particularly valuable in the treatment of infections caused by organisms upon which penicillin, streptomycin and certain other antimicrobial agents have no effect.

It has been used successfully, for instance, in the treatment of virus pneumonia, anthrax, whooping cough and scrub typhus. Laboratory studies indicate it may prove effective in treating Rocky Mountain Spotted Fever, Q fever and influenza.

Should your physician prescribe terramycin for you, our prescription department is at your service.
