DECKS...Continued from page 36

to build, but, for greater interest, angled, circular or free-form shapes are possibilities. The shape should be related to the house form and existing or planned yard landscaping.

Solid or partially open roofs may be added to decks for weather protection and shade. Solid roofs include plywood or wood planks, translucent corrugated plastic and canvas. Many interesting filtered shade effects can be obtained with space lath, 1 x 2's or woven reed supported by exposed beams or rafters.

Most decks require concrete footings usually in the form of piers spaced to support the posts holding up the deck structure. Piers can be formed with wood boxes about 12 inches square or 10 to 16 inch diameter metal duct. The bottom of the piers should rest on firm soil below the frost line. Check your local building department for requirements.

The basic framework of the deck can be framed with dimension lumber such as 4 x 4's for posts and 2 x 6's to 2 x 12's for beams and joists. Posts should be firmly anchored to footings.

Framing members can be fastened to each other with bolts, strap metal, sheet metal connectors or nails for lighter members. All fasteners should be corrosion resistant.

Deck floors are usually 2 x 4 or 2 x 6 lumber spaced about one-quarter inch apart and nailed to supporting members with hot-dipped galvanized nails. Lumber laid flat will span up to 48 inches. Many different patterns can be formed with decking including diagonal patterns, squares or rectangles with lumber at right angles, and variations in lumber widths.

A popular framing and deck material is clear all heart or construction heart redwood. Red cedar, Douglas fir, white fir and other species are also suitable. Select structural grades provide better appearance and extra strength.

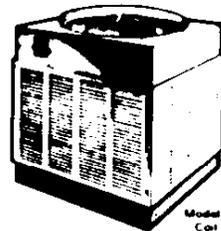

Make your deck more attractive and useful with Built-in seating, planters, night lighting, barbecue, storage units and privacy screening can also help to make a deck more attractive and useful.

GE Spring Sale
