playment of a tent to cover the tree and conduct the gas sufficiently long to full the insects. A careful study of the insect's hab-lins, extending through an onlife year at least, will be necessary to deter-ning the mast vulnerable period in the insect slife-history.

### Grow Tomatoes.

lice, are absent, these having fallen away with age. This white marginal ring, surround-ing the body of the insect, consists of a somewhat fibrous, waxy material, se-creted by the developing insect. It becomes itrmly attached to the bark and curied laward, where its edge is somewhat fringed. The body becomes with age dark brown, smooth, convex longitudinally; the segmentation usu-ally remaining distinct. The preceding description applies to the female only. The male lakeet naukes a very different, form. As the males do not take food, they may be found at any point on the bark, usu-ally, however, in more or less pro-tecting spots. On nearing maturity, the males secret a minute pocket like case, or cocoon, within which, they cast their larval skin, and seculies a single pair of , wings, They then
