Clean the drinking cups. They set filled easily with bay, straw, eratin and small pleese of corn cobs. A cow needs plenty of wai-ter.

Unfrost the outside of light ulbs --- wash off the fly spray

bulbs — wasn off the hy spins, and fly specks.

Get a bag of ready-mix cement and seal up rat holes and broken places around the stanchions and walls. Do it before the cows are in all day and all night.

Law Requires Labeling Rayon

Confused about the different types of rayon?
Because these types vary so greatly, the Federal Trade Commission has recently ruted that all rayon made by the viscose process must be labelled "rayon" and that made by the caretat process tabelled "acetate". Rayon made by the cupramionium process is add under the trade name of "Bemberz".

If you are planning to plant vetch this fall, better check the seed for holes. The reason, say entomologists at Michigan State College, is that a vetch weevil has appeared for the first time in Michigan this year, and it's damaging to see

"Demberg".

Many fabries are blends of both rayon and acetate. If so, both names must be on the label.

How do they differ? Clothing and textiles specialists at Michigan State College point out these characteristics of the different results with the part of the MSC demarked that farmers in Van Buren, Kent and Allegan Counties are having such as the college point out these characteristics of the different republic with the past. Examino

types.

Ruyon and Bemberg dry slowly and are cool to wear. They do
not melt under a hot iron and are
not subject to gas-fading. However, white rayon and Bemberg
will gradually turn to ivory over
a perido of time.

Acetate, on the other hand, will
melt under a hot iron and is subject to gas-fading, However, it is
more crease and solf-resistant and
white stays white.

If nurse crops are starved for fertilizer to limit their growth, legume seedings in them also will be starved, cautions Richard M Swenson, MSC research soil scient-ist.

ject to gas-fading. However, it is more crease and solf-resistant and white stays white. "Chromspun" and "Celaperm" are trade names for made-in-color acetate yarns and staple fiber. Coloring agents are introduced in these at the solution stage, before the fiber is actually formed. ist.

He points out that when 50 pounds of 4-24-12 fertilizer wer put on an acre in MSC experiments, wheat and oat yields in creased 10 to 20 bushels per acr and alfalfa yields nearly doubled

Problems In Education Never Completely Solved

"Do not be discouraged if you ave not solved all the problems ave not solved all the problems here are in education, because by the time you reach these goals, onditions will have changed and ow will have to start all over acin," declared Dr. Clair L. Tay-or, State Superintendent of Public Instruction, speaking to school oard members, school officials and laymen on the future of education of the characteristics.

Courage without conscience is wild beast.

Chlordane, Oil, 2-4D Mixture Kills Weeds

Chlordane kills crab grass and chickweed but is not so effective on other broad-leaved weeds, points out B. H. Grigsby, Michigan State College weed control specialist. Chlordane mixed with the dster form of 2,4-D in an oil the ester form of 2,4-D in an oil spray gives a fairly complete weed kill, he advises. He suggests a tablespoonful of the 2,4-D ester to each gallon of chlordane-oil mixture. Chlordane is an effective control only if it is mixed with oil.
